

ACKNOWLEDGEMENTS

The successful completion of the project on developing a fluorometric method for carbaryl determination using MCM-41 containing cetyltrimethylammonium bromide was made possible through the support of research funding, access to laboratory facilities, and the invaluable guidance of Assoc. Prof. Dr. Sanchai Prayoonpokarach, my thesis supervisor, dedicated his time to advising the research and assisting in information gathering.

I sincerely appreciate the members of the analysis and catalysis group for their valuable advice, assistance during the experiments, and support in resolving various challenges, all of which played a crucial role in the project's success.

Finally, I would like to express my gratitude for the research subsidy from the Fundamental Fund (FF66) under the Science, Research, and Innovation. I also extend my thanks to The Center for Scientific and Technological Equipment at Suranaree University of Technology, along with the laboratory staff and personnel who provided assistance and facilitated access to the instruments. I am grateful for the ongoing support provided by the School of Chemistry, Institute of Science, Suranaree University of Technology, which greatly contributed to the success of this project.
